

What's New in VS Code?

Version 1.110 – February 2026

Your editor just got a major AI upgrade

Shinya Yanagihara (Dev GBB)

5 Things You'll Love

1.  Your AI assistant now has an **app store**
2.  AI can **test your website** by itself
3.  AI **remembers your plan** – even in long conversations
4.  **Branch your chat** like you branch code
5.  See **images** right in your terminal

Agent Plugins

An App Store for AI Helpers

- Install ready-made **AI skill packs** from the Extensions view
- Each pack can include tools, commands, and automations
- Search `@agentPlugins` to browse available plugins
- Works with plugins from **multiple AI providers** – not just Copilot

Think of it like installing an extension, but for your AI assistant's abilities

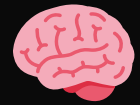

AI Drives Your Browser

Build It, Test It – Hands Free

- Your AI can now **open a browser** inside VS Code
- It can click buttons, fill forms, read pages, and take screenshots
- It sees errors in the console – just like you would
- All in a **private session** – your logged-in accounts stay safe

The AI writes code, opens the browser, checks if it works, and fixes issues – all by itself

Your AI Remembers the Plan

No More "What Were We Doing?"

- When you create a plan with the AI, it **stays in memory**
- Even after long conversations or topic changes
- Even when old messages are summarized to save space
- Come back to your plan anytime – no need to re-explain

Compress Your Chat

When Conversations Get Too Long

- Type `/compact` to **summarize the conversation** and free up space
- Add guidance: `/compact focus on the database decisions`
- Works everywhere: local, background, and Claude agent sessions
- VS Code also compresses automatically when running low on space

Fork Your Conversation

Branch Your Chat Like Git

- Type `/fork` to **create a copy** of your conversation
- Try a different approach without losing the original
- Or hover on any message → **Fork Conversation** from that point
- Each fork is independent – experiment freely!

See What Your AI Is Doing

Agent Debug Panel

- New panel shows **everything the AI is doing** in real time
- See which tools it's calling, what prompts are loaded
- Includes a **flow chart view** – like a visual timeline
- Great for understanding why the AI made certain choices

Open via: Command Palette → **Developer: Open Agent Debug Panel**

YOLO Mode

Skip All the "Are You Sure?" Prompts

- Type `/yolo` to let the AI **run without asking permission**
- Type `/disableYolo` to turn it back off
- Great for when you trust the task and want speed

 Use with care – the AI won't ask before running commands or changing files

Goodbye, Edit Mode

One Mode to Rule Them All

- **Agent Mode** now does everything Edit Mode could – and more
- Edit Mode is hidden by default starting now
- It will be **completely removed** in about 15 releases
- If you loved Edit Mode, you can create your own custom agent that works the same way

Pictures in Your Terminal

Kitty Graphics Protocol

- The VS Code terminal can now **show images** 🎉
- Supports PNG, RGB, and RGBA formats
- Images scroll with text and clean up automatically
- Turn it on: enable `terminal.integrated.enableImages`

💡 Try it with tools like `kitten icat` on macOS/Linux

AI Predicts Your Next Edit

Long-Distance Next Edit Suggestions

- AI suggestions now appear **anywhere in your file** – not just near your cursor
- It watches what you're doing and predicts what you'll change next
- New **eagerness control**: choose more suggestions vs. more relevant ones
- Find the slider in the **Copilot Status Bar**

One Setting, Two Languages

Unified JavaScript & TypeScript Settings

- **Before:** change `javascript.format.enable` AND `typescript.format.enable`
- **After:** change `js/ts.format.enabled` – applies to both!
- Old settings still work, but they're being retired
- This prepares VS Code for **TypeScript 6.0 and 7.0**

Python Setup Made Easy

Python Environments Extension – Now for Everyone

- Manage **venv**, **conda**, **pyenv**, **poetry**, **pipenv** – all in one place
- **Quick Create**: one click to create a new environment
- Install and remove packages right from the sidebar
- Settings are portable – share them across machines

Coming to everyone automatically over the next few weeks

AI for Everyone

Accessibility Improvements

- **Screen reader users:** toggle AI thinking content, navigate question carousel
- **Keyboard shortcut:** `Ctrl+Shift+T` to jump between TODO list and chat
- **Notifications:** sound + OS alert when AI needs your attention
- **New skill:** ask the AI to make features accessible – it knows the guidelines

Terminal Sandboxing

Keep AI Commands Contained

- AI terminal commands can now run in a **sandbox**
- Control which websites the AI can access
- Control which files the AI can touch
- No extra software needed on macOS

 Pair with YOLO mode for fast BUT safe AI workflows

Move Your Notifications

Small Fix, Big Quality of Life

- Notifications used to block the Chat view in the corner
- Now choose: **top-right**, **bottom-right**, or **bottom-left**
- Set `workbench.notifications.position` to your preference

Key Takeaways

-  **Plugins** bring an app store experience to AI assistants
-  **Browser tools** let AI test your web apps end-to-end
-  **Session memory** makes long AI conversations practical
-  **Edit Mode** is going away – Agent Mode replaces it
-  **JS/TS settings** are being unified – start migrating
-  **Python Environments** is now available for everyone

Thank You! 🙏
